Web Fundamentals

How the web works and what I need to learn

Przemysław
GOMYCODE · Web Fundamentals Checkpoint

How the web works

1. Enter a web address	The browser uses DNS to find the server’s IP address.
2. Request the page	The browser sends an HTTP request. HTTPS encrypts the connection.
3. Receive the response	The server returns the requested resources, such as HTML.
4. Display the website	The browser processes HTML, loads CSS and JavaScript, and displays the page.

The internet connects networks. The web is one service that uses it.

The basic languages

HTML

What the page contains

HyperText Markup Language

Gives content structure and meaning: headings, paragraphs, links and forms.

CSS

How the page looks

Cascading Style Sheets

Controls layout, colours and fonts. Helps pages work on different screen sizes.

JavaScript

How the page responds

A programming language

Handles clicks, checks form input and updates content without a full page reload.

What I need as a web developer

The role

A web developer builds and maintains websites and web applications, adds features and fixes bugs. Developers also work together to solve problems.

Tools and skills

HTML, CSS and JavaScript
VS Code and a browser with developer tools
Git to track changes; GitHub to share work

My learning path

Learn HTML, CSS and JavaScript.
Build small pages and practise Git.
Then explore front-end or back-end work; full-stack combines both.

How I will learn

Break tasks into smaller steps.
Search with precise keywords and read the documentation.
Try examples, test and fix mistakes.

Why I want to learn web development

I want to develop professionally and gain new technical skills.

My goal is to move towards a more senior role.
I want to understand how websites work and build them myself.
